Paper Title

Agentic AI for Conversational Architectural Floor Plan Generation

Track Name

Main Track Phase 2

Reviewer #3

Questions

3. Final Recommendation

Accept with Minor Revision

4. Reviewer Comments (Regarding technical suitability/ Novelty/ Feasibility/ Language / Results).

Need detailed information about each step given in the proposed architecture(fig 1)

Obtained values for evaluation metrics are shown/discussed in table 1(i.e coverage etc)

4. Reviewer Comments (Regarding technical suitability/ Novelty/ Feasibility/ Language / Results).

The paper is well organized and easy to read, and it addresses an interesting problem in conversational architectural floor plan generation using an agentic AI framework.

The motivation is clearly explained, and the overall pipeline shows good practical relevance for early-stage design automation. The integration of conversational interaction with graph-based generation is meaningful and fits well within the conference scope.

That said, the technical depth could be improved by adding clearer mathematical formulation and a more detailed explanation of the agent's decision-making process.

The experimental section would also be stronger with more rigorous quantitative comparison against existing methods and the inclusion of an ablation study. The language

quality is generally good, though a few minor grammatical corrections and higher-resolution figures would further improve presentation.

Overall, this is a promising piece of work and can be recommended for acceptance after minor revision to enhance technical clarity and experimental validation.
